

2b:

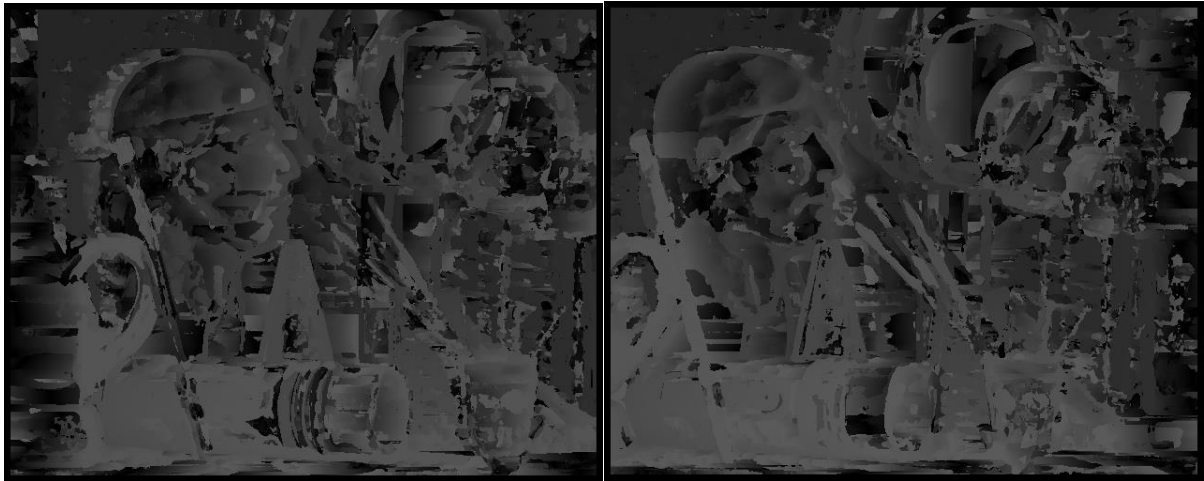

The ground truth images are much crisper and defined, however you can still see the outline of some shapes in my results images.

3a:

The results of these images was visibly worse than the originals. You can see the noise transfers in the disparity maps. They are about as noisy as the input images I created.

3b:

The effect of increasing the contrast was that the disparity map became less clear. You can still see the outline of some shapes however within the shapes there is a lot more back and forth between light and dark spots, which makes sense since we increased the contrast.
